# Sandia Canyon Temperature Investigation

Perennial Reach of Sandia Canyon  
Classified Segment - 20.6.4.126 NMAC  
Assessment Unit NM-9000.A\_47

December 5, 2018

# Study Area – Assessment Unit NM-9000.A\_47

# Perennial Reach of Sandia Canyon

*NPDES Outfall to Sandia Canyon*

- *Effluent dominated stream*
- *NPDES Outfalls 001, 199 and 027 Discharge to Sandia Canyon*
- *2005 - Classified Aquatic Life Use: Cold Water w/Segment Specific Temperature Criteria - 24°C (2005)*
- *2010 Temperature Criteria Changed to 6T3 20°C*
- *October 2014 NPDES Permit NM0028355 issued with 6T3 temperature limits*

# Outfall 001 Temperatures Summer 2016

*Future 6T3 (20°C) cannot be met without decreasing temperature prior to discharge.*

# Use Attainability Analysis (UAA)

- *UAA is a study to determine use attainability (Cold Water Aquatic Life)*
- *A designated use, which is not an existing use, may be removed if the State can demonstrate that attaining the designated use is not feasible because:*
  - 1. Naturally occurring pollutant concentrations prevent the attainment of the use; or**
    1. Natural, ephemeral, intermittent or low flow conditions or water levels prevent the attainment of the use, unless these conditions may be compensated for by the discharge of sufficient volume of effluent discharges without violating State water conservation requirements to enable uses to be met; or
    2. Human caused conditions or sources of pollution prevent the attainment of the use and cannot be remedied or would cause more environmental damage to correct than to leave in place; or Dams, diversions or other types of hydrologic modifications preclude the attainment of the use and it is not feasible to restore the water body to its original condition or to operate such modification in a way that would result in the attainment of the use; or
    3. Dams, diversions, or other types of hydrologic modifications preclude the attainment of the use, and is not feasible to restore the water body to its original condition or to operate such modification in a way that would result in attainment of the use.
    4. Physical conditions related to the natural features of the water body, such as the lack of a proper substrate, cover, flow, depth, pools, riffles, and the like, unrelated to water quality, preclude attainment of aquatic life protection uses; or
    5. Controls more stringent than those required by sections 301(b) and 306 of the Act would result in substantial and widespread economic and social impact

# Thermograph Deployment July 2014 to September 2018

*Thermographs in Sandia Canyon at E123 and Below E123*

# NPDES Outfall 001 vs TA-06 Air Temperatures Summer 2015

# E123 Thermograph vs TA-06 Air Temperature Summer 2015

# Temperatures at E123 and NPDES Outfall 001

# Thermograph Below E123 vs TA53 Air Temperatures Summer 2016

# Air-Water Temperature Correlation - Tool for identifying appropriate stream classifications and attainable aquatic life use subcategories (NMED 2011)

*Maximum weekly average (water) temperature equal to July average air temperatures  $MWAT = ATEMP$  (July Average Air Temperature)*

*Attainable aquatic life use subcategories can be related to July average air temperatures, as follows:*

- high quality and coldwater uses may be attainable if average air temperatures  $\leq 18^{\circ}\text{C}$*
- \*marginal coldwater and coolwater uses may be attainable if average air temperature is  $\leq 23^{\circ}\text{C}$*
- uses more restrictive than warmwater may be attainable if July average air temperature is  $\leq 23^{\circ}\text{C}$*

*\*TA-06 July 2015 Air Temperature Average (ATEMP) –  $18.9^{\circ}\text{C}$*

*\*PRISM July 2015 (publicly available temperature model) – gridded data for July temperatures for any location in the U.S. (<http://www.prism.oregonstate.edu>) –  $20.2^{\circ}\text{C}$*

# E123 Thermograph Temperatures vs WQS 20°C

*Water Quality Standard of 6T3 20°C exceeded during period of July 24<sup>th</sup> through July 28<sup>th</sup> (6T3 – 6 consecutive hours on 3 consecutive days)*

# Sandia at Sigma Canyon – Summer 2016

*Air-water temperature correlation applicable unless there are significant groundwater inputs or microclimate effects*

- *Infiltration in wetland area with lateral movement through alluvial - emerging down stream below E123*
- *Microclimate effects and 300' culvert*
